MAT447: Project 7
Mathematica Homework
Blake Willoughby
Arizona State University
October 10, 2017
```

6. Create a Mathematica function that accepts a passage of English plaintext (including punctuation and spaces) as input and returns an integer that represents the plaintext as in question 1. Test your function.

```
alphaToNumRSA[plainT_] := Module[{string, numSet, temp, spacePunctCount, i, j},
       temp = 0;
       string = plainT;
       numSet = ToCharacterCode[string];
       spacePunctCount = 0;
       For [j = 1, j \le StringLength[string] - spacePunctCount, j++,
            temp = numSet[[j]];
            If[temp > 64 && temp < 91, numSet[[j]] += 32,];</pre>
            If [(\text{temp} \ge 32 \& \text{temp} \le 64) \mid | (\text{temp} \ge 91 \& \text{temp} \le 96) \mid | (\text{temp} \ge 123 \& \text{temp} \le 126)),
                  numSet = Drop[numSet, {j}];
                 spacePunctCount++;
                 j = j - 1;
             ,];
       ];
       numSet = numSet - 96;
       For [i = 1, i \le Length[numSet], i++,
        If[numSet[[i]] > 0 && numSet[[i]] < 10, numSet[[i]] = {0, numSet[[i]]},];</pre>
        If[numSet[[i]] ≥ 10 && numSet[[i]] < 20, numSet[[i]] = {1, Mod[numSet[[i]], 10]},];</pre>
        If[numSet[[i]] ≥ 20 && numSet[[i]] < 27, numSet[[i]] = {2, Mod[numSet[[i]], 10]},];</pre>
       ];
       numSet = Flatten[numSet];
       numSet = FromDigits[numSet];
       numSet

8. Create a Mathematica function that accepts RSA ciphertext and an RSA public key as input, then returns the plaintext. Use your function to decrypt the RSA ciphertext 102624265650629462932986, which was encrypted using public key (199319989752662759279209,5). Test the limits of your function's ability to decrypt RSA in a reasonable amount of time if only the ciphertext and public key are

known.

```
In[244]:= decryptRSA[cipherText_, modulus_, exponent_] :=
       Module [{cipherT, n, e, d, plainText, p, q, m, base, squares, primes, temp, i, j, k},
         cipherT = cipherText;
         n = modulus;
         e = exponent;
         primes = FactorInteger[n];
         p = primes[[1, 1]];
